

6-Step Simple Orange-Fleshed Sweet Potato (OFSP) Planting Guide

1

Collect clean loamy soil (to fill up a 50kg sack) and 1kg dried poultry manure.

2

Mix 50kg soil with 1kg of dried poultry manure.

3

Make small drainage holes at the bottom of the sack.

4

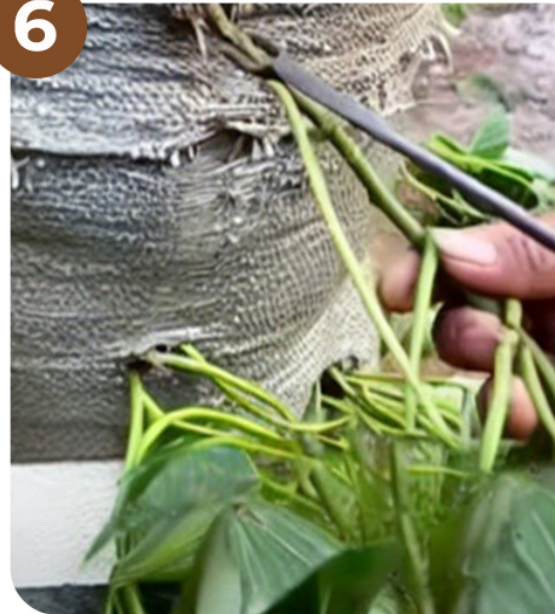

Fill the sack with the mixed soil

5

Get healthy OFSP vines. Look for 3 nodes (growing points) on each vine and get ready to plant.

6

Use a stick/rod to fit in the vines on top and sides of the sack (ensuring at 3 nodes are buried in the soil). Space evenly around the sack (6-8 vines around a 50kg sack).

- Water daily to avoid wilting of the leaves (avoid waterlogging) and place sack where it gets at least 6 hours of sunlight daily.
- Staking: Tie growing vines with twine to sticks or supports to guide growth

Ready for Harvest

Sign (What to look for)

- Vines start to dry naturally (turn yellow).
- About 2-3 months have passed.
- Soil surface slightly raised or cracked where tubers have formed.

Action

- Gently tear up the sack, loosen the soil and harvest tubers by hand.

Disease or Pest Infection

Sign (What to look for)

- Leaves have spots, holes, or are turning yellow/brown.
- Presence of insects or visible pests on vines.

Action

- Remove and destroy infected leaves or vines.
- Inform an extension worker for advice.
- Keep the area clean to avoid more pests.
